The involute gear profile is the most commonly used system for gearing today. In an involute gear, the profiles of the teeth are involutes of a circle. (The involute of a circle is the spiraling curve traced by the end of an imaginary taut string unwinding itself from that stationary circle.)
In involute gear design, all contact between two gears occurs in the same fixed, flat plane even as their teeth mesh in and out. Further, the contacting surfaces are always perpendicular to the plane of contact, so the dominant contact forces (in a well lubricated system) are always parallel to the plane. This way, the moment arms are kept constant. This is key to minimizing the torque/speed variations which produce vibration and noise in lower quality gears. Note that the involute profile does not prevent the teeth from scraping each other every time they mesh, and this is the dominant source of wear. It is not possible to design a gear tooth profile which rolls through the mesh without friction.

The figure $\mathrm{N}^{\circ} 1$ show the involute curve generation with the most important elements.

Fig. ${ }^{\circ} 1$

The parametric equations of involute of a circle are::

$$
\begin{aligned}
& R=\frac{r_{g}}{\cos \psi}=r_{g} \cdot \sec \psi \\
& \varphi=\tan \psi-\psi=\operatorname{inv}(\psi)
\end{aligned}
$$

Because we must use many formulas, it's better to show the list of symbols and indices utilized.

| Meaning of symbols |  |  |  |
| :---: | :---: | :---: | :---: |
| a | Center distance | m | Module |
| $\alpha$ | Pressure angle | Q | Dimension over pins or balls |
| $\beta$ | Helix angle | r | Radius |
| d | Diameter | $\mathrm{R}_{\mathrm{a}}$ | Radius to start of active profile |
| g | Length of contact | S | Tooth thickness on diameter d |
| $\mathrm{g}_{1}$ | Legth of recession | $\bar{s}_{\text {os }}$ | Chordal thickness |
| $\mathrm{g}_{2}$ | Length of approach | t | Pitch |
| $\mathrm{h}_{\mathrm{f}}$ | Dedendum | w | Chordal thickness over z' teeth (spur gears) |
| $\mathrm{h}_{\mathrm{k}}$ | Addendum | W | Chordal thickness over z' teeth (helical gears) |
| $\mathrm{h}_{0}$ | Corrected addendum | z | Number of teeth |
| $\mathrm{h}_{\mathrm{r}}$ | Whole depth | X | Profile correction factor |
| 1 | Tooth space |  |  |
| Meaning of indices |  |  |  |
| b | Reffered to rolling diameter | n | Reffered to normal section |
| c | Referred to roll diameter of basic rack | 0 | Reffered to pitch diameter |
| f | Reffered to root diameter | q | Reffered to the diameter throug balls center |
| g | Reffered to base diameter | r | Reffered to balls |
| k | Refferred to outside diameter | s | Reffered to transverse section |
| i | Refferred to equivalent | w | Reffered to tool |

## Determination of base tooth thickness from a known thickness and vice-versa.

$$
s_{g}=(\psi+2 \vartheta) \cdot r_{g} \quad \text { where } \quad \psi=\frac{s}{r}
$$

and vice-versa is:

$$
s=\left(\frac{s_{g}}{r_{g}}-2 \cdot i n v \alpha\right) \cdot r
$$

Where we can see $\vartheta=\operatorname{inv} \alpha$ where $\alpha$ is the pressure angle in the points E and D . We can understand immediately the importance of the function inv $\alpha$.

Fig. ${ }^{\circ}{ }^{\circ}$

## Cylindrical spur gears with standard profile

On base to figure $N^{\circ} 3$ the following relation are valid:

Fig. $N{ }^{\circ} 3$
$d_{o}=m \cdot z$

$$
\begin{aligned}
& h_{r}=h_{k}+h_{f} \\
& d_{k}=d_{o}+2 h_{k} \\
& d_{f}=d_{o}+2 h_{f} \\
& S_{o}=\frac{m \cdot \pi}{2}
\end{aligned}
$$

$t_{o}=m \cdot \pi$
$d_{g}=d_{o} \cdot \cos \alpha_{o}$
$t_{g}=t_{o} \cdot \cos \alpha_{o}$
$h_{k}=m$
$h_{f}=\frac{7}{6} \cdot m \quad$ or $\quad h_{f}=\frac{5}{4} \cdot m$

## Cylindrical spur gears with corrected profile

The distance between the pitch line of the rack (a) (see figure $\mathrm{N}^{\circ} 4$ ) and the rolling line (b) is called corrected profile $\boldsymbol{x} \cdot \boldsymbol{m}$. The corrected profile is positive when the pitch line of the rack is above the cutting pitch circle of the gear. In the opposite case there is minus correction.
a)- Without center distance variation (fig. N 4):
$h_{k}=m+x \cdot m$
$h_{f}=\frac{7}{6} \cdot m-x \cdot m \quad$ or $\quad h_{f}=\frac{5}{4} \cdot m-x \cdot m$
$s_{o c}=\frac{m \cdot \pi}{2}+2 \cdot x \cdot m \cdot \tan \alpha_{o}$

Fig. ${ }^{\circ} 4$
b)- With center distance variation (fig. $N$ 5)
$\operatorname{inv} \alpha_{b}=\operatorname{inv} \alpha_{o}+2 \tan \alpha_{o} \frac{x_{1}+x_{2}}{z_{1}+z_{2}}$
$a_{b}=a \frac{\cos \alpha_{o}}{\cos \alpha_{b}} \quad d_{b}=\frac{d_{g}}{\cos \alpha_{b}}$
$s_{b}=r_{b}\left[\frac{s_{o c}}{r_{o}}+2\left(\operatorname{inv} \alpha_{o}-\operatorname{inv} \alpha_{b}\right)\right]$
$k=\frac{z_{1}+z_{2}}{2}\left[2 \frac{x_{1}+x_{2}}{z_{1}+z_{2}}-\left(\frac{\cos \alpha_{o}}{\cos \alpha_{b}}-1\right)\right]$
$d_{k}=m(z+2+2 x-2 k)$

$$
h_{r}=m(2,25-k) \quad \text { or } \quad h_{r}=m(2,167-k)
$$

Cylindrical helical gears with standard profile (Fig. $N^{\circ}$ 6)
$d_{o}=m_{s} \cdot z$
$d_{g}=d_{o} \cdot \cos \alpha_{o s}$
$m_{n}=m_{s} \cdot \cos \beta_{o}$
$t_{o s}=m_{s} \cdot \pi$
$t_{g s}=t_{o s} \cdot \cos \alpha_{o s}$
$\tan \alpha_{o n}=\tan \alpha_{o s} \cdot \cos \beta_{o}$
$t_{o n}=m_{n} \cdot \pi$
$t_{g n}=t_{o n} \cdot \cos \alpha_{o n}$
$h_{k}=m_{n}$
$h_{r}=h_{k}+h_{f}$
$h_{f}=\frac{7}{6} \cdot m_{n} \quad$ or $\quad h_{f}=\frac{5}{4} \cdot m_{n}$
$d_{k}=d_{o}+2 h_{k}$
$d_{f}=d_{o}+2 \cdot h_{f}$
$s_{o n}=\frac{\pi \cdot m_{n}}{2} \quad s_{o s}=\frac{\pi \cdot m_{s}}{2}$

## Cylindrical helical gears with corrected profile

a)- Without center distance variation (fig. $\mathrm{N}^{4}$ ).
$h_{k}=m_{n}+x \cdot m_{n}$
$h_{f}=\frac{7}{6} \cdot m_{n}-x \cdot m_{n} \quad$ or $\quad h_{f}=\frac{5}{4} \cdot m_{n}-x \cdot m_{n}$
$s_{o n c}=\frac{m_{n} \cdot \pi}{2}+2 \cdot x \cdot m_{n} \cdot \tan \alpha_{o n}$
$s_{o s c}=\frac{m_{s}^{2} \cdot \pi}{2}+2 \cdot x \cdot m_{n} \cdot \tan \alpha_{o s}$
b)- With center distance variation (fig. $N$ o5)
$\operatorname{inv} \alpha_{b s}=\operatorname{inv} \alpha_{o s}+2 \tan \alpha_{o n} \frac{x_{1}+x_{2}}{z_{1}+z_{2}}$
$a_{b}=a \frac{\cos \alpha_{o s}}{\cos \alpha_{b s}} \quad d_{b}=\frac{d_{g}}{\cos \alpha_{b s}}$
$s_{b s}=r_{b}\left[\frac{S_{o s c}}{r_{o}}+2\left(i n v \alpha_{o s}-i n v \alpha_{b s}\right)\right]$
$k=\frac{z_{1}+z_{2}}{2}\left[2 \frac{x_{1}+x_{2}}{z_{1}+z_{2}}-\frac{1}{\cos \beta_{o}}\left(\frac{\cos \alpha_{o s}}{\cos \alpha_{b s}}-1\right)\right]$
$d_{k}=m_{n}\left(\frac{z}{\cos \beta_{o}}+2+2 x-2 k\right)$
$h_{r}=m_{n}(2,25-k) \quad$ or $\quad h_{r}=m_{n}(2,167-k)$

## Length of contact and contact radius $\boldsymbol{R}_{\underline{a}}$

$\rho_{k 1}=\sqrt{r_{k 1}^{2}-r_{g 1}^{2}} \quad \rho_{k 2}=\sqrt{r_{k 2}^{2}-r_{g 2}^{2}}$
$g=\rho_{k 1}+\rho_{k 1}-a_{b} \cdot \sin \alpha_{b}$
$g_{1}=\rho_{k 1}-r_{b 1} \cdot \sin \alpha_{b}$
$g_{2}=\rho_{k 2}-r_{b 2} \cdot \sin \alpha_{b}$
$R_{a 1 o 1}=\sqrt{\left(\rho_{k 1 o 1}-g\right)^{2}+r_{g 1 o 2}^{2}}$

Fig. $\mathbf{N}^{\circ} 9$
Interference
Maximum outside diameter without interference:

$$
d_{k \max }=\sqrt{d_{g}^{2}+\left(2 a_{b} \cdot \sin \alpha_{b}\right)^{2}}
$$

Chordal thickness and corrected addendum (fig.10)
$\frac{s_{O}}{\pi \cdot d}=\frac{\delta}{2 \cdot \pi} \quad$ and $\quad \delta=\frac{2 \cdot s_{O}}{d}$
$\overline{s_{o}}=d \cdot \sin \frac{\delta}{2}$
$h_{o}=h_{k}+\frac{d}{2}\left(1-\cos \frac{\delta}{2}\right)$

Fig. ${ }^{\circ} 10$

## Span measurement over Z' teeth

Fig. $\mathbf{N}^{\circ} 11$
For spur gears:

$$
w=m \cdot \cos \alpha_{o} \cdot\left[\left(z^{\prime}-1\right) \pi+\frac{s_{o}}{m}+z \cdot i n v \alpha_{o}\right]+2 \cdot x \cdot m \cdot \sin \alpha_{o}
$$

The number of teeth Z in the span is:
$z^{\prime}=z \frac{\alpha_{o}}{180^{\circ}}+0,5 \quad$ (with $\alpha_{o}$ in degree)
The result should be rounded off to the next highest whole number.
For gear with profile correction $\geq 0,4 \cdot \mathrm{~m}$ teh formula is:
$z^{\prime}=z \frac{\alpha_{o}}{180^{\circ}}+0,5+z \cdot \frac{\tan \alpha_{x}}{\pi}-(z+2 x) \frac{\tan \alpha_{o}}{\pi} \quad$ where
$\tan \alpha_{x}=\sqrt{\tan ^{2} \alpha_{o}+4 \frac{x}{z} \sec ^{2} \alpha_{o}+4\left(\frac{x}{z}\right)^{2} \sec ^{2} \alpha_{o}}$

## For helical gears:

$$
w=m_{n} \cdot \cos \alpha_{o n} \cdot\left[\left(z^{\prime}-1\right) \pi+\frac{s_{o n}}{m_{n}}+z \cdot \operatorname{inv} \alpha_{o s}\right]+2 \cdot x \cdot m_{n} \cdot \sin \alpha_{o n}
$$

where
$z^{\prime}=z\left(\frac{\alpha_{o s}}{180^{\circ}}+\frac{\tan \alpha_{o s} \cdot \tan ^{2} \beta_{g}}{\pi}\right)+0,5 \quad$ (con $\alpha_{o}$ in degree)
This method of checking can only be used when
$b \geq w \cdot \sin \beta_{g}+b_{M} \cdot \cos \beta_{g}$
where $\beta_{g}$ is the length of the contact lines between little dishes and teeth (figura ${ }^{\circ}{ }^{\circ} 12$ ).

Fig. ${ }^{\circ} 12$
If the gear has a large profile correction, then $z$ should be calculated as follow:
$z^{\prime}=z \frac{\alpha_{o s}}{\pi}+0,5+\frac{z}{\pi} \cdot \frac{\sqrt{\tan ^{2} \alpha_{o n}+4 \frac{x}{z} \cos \beta_{o}\left(1+\frac{x}{z} \cos \beta_{o}\right)\left(\tan ^{2} \alpha_{o n}+\cos ^{2} \beta_{o}\right)}}{\cos \beta_{o}\left(\sin ^{2} \alpha_{o n}+\cos ^{2} \beta_{o} \cdot \cos ^{2} \alpha_{o n}\right)}-$ $-\frac{z}{\pi} \tan \alpha_{o s}-2 \frac{x}{\pi} \tan \alpha_{o n}$

Fig. ${ }^{\circ} 13$

Spur gears with even number of teeth
$\operatorname{inv} \alpha_{q}=\operatorname{inv} \alpha_{o}+\frac{d_{r}}{2 r_{o} \cdot \cos \alpha_{o}}-\frac{l_{o}}{2 r_{o}} \quad$ from which we have $\alpha_{q}$
$r_{q}=r_{o} \frac{\cos \alpha_{o}}{\cos \alpha_{q}} \quad Q=\mathbf{2} \cdot \boldsymbol{r}_{\boldsymbol{q}}+\boldsymbol{d}_{\boldsymbol{r}}$
Spur gears with odd number of teeth
With the same $\quad \alpha_{q}$ e $r_{q} \quad$ we obtain $\quad Q=2 \cdot \boldsymbol{r}_{\boldsymbol{q}} \cdot \cos \frac{\pi}{2 z}+\boldsymbol{d}_{\boldsymbol{r}}$

Helical gear with even number of teeth
$\operatorname{inv} \alpha_{q s}=\operatorname{inv} \alpha_{o s}+\frac{d_{r}}{2 r_{o s} \cdot \cos \beta_{o} \cos \alpha_{o n}}-\frac{l_{o s}}{2 r_{o s}}$
$r_{q s}=r_{o s} \frac{\cos \alpha_{o s}}{\cos \alpha_{q s}} \quad Q=\mathbf{2} \cdot \boldsymbol{r}_{\boldsymbol{q s}}+\boldsymbol{d}_{\boldsymbol{r}}$
Helica gears with odd number of teeth
With the same $\alpha_{q s}$ e $r_{q s}$ we obtain

$$
Q=2 \cdot r_{q s} \cdot \cos \frac{\pi}{2 z}+d_{r}
$$
